Heat Stroke

In these warm Summer months 'heat stroke' in our pets is something we need to consider. It usually occurs after exercise in hot and humid weather or when left inside a warm car.

Some breeds with altered facial structures such as bulldogs and pugs have an increased risk of developing heat stroke. This is because the changes to their face hinder their ability to pant and they cannot regulate their temperature effectively.

Things to looks out for include:

Panting with difficulty breathing. There can be changes in the noise they make while breathing.

Depression, lethargy and disorientation

Seizures

Bright red/blue tinged gum colour

Bloody diarrhoea

Dark coloured urine

We provide:

- Surgery & Medicine for small and large animals
- Herd Health Advice
- Soft Tissue & Orthopaedic Surgery
- Dentistry
- Digital X-ray
- Ultrasound
- In House Blood Testing
- Nutrition
- Prescription Diets
- Microchip Identification

If you suspect your pet has heat stroke you can stand them under cold water for two minutes to completely wet their coat. Cool wet towels will also assist to reduce their temperature.

In severe cases please contact your vet for further advice.

Intravenous fluids are sometimes required to assist in the cooling of your pet and in severe cases medication is required to stop seizures.

Simpson Office:

Our Simpson Office is open Monday & Friday 10am to 3pm P: 03 5594 3257

Colac Office:
